Foodborne pathogens continue to cause major public health problems worldwide. These organisms are the leading causes of illness and death in less developed countries, killing approximately 1.8 million people annually. In developed countries Foodborne pathogens are responsible for millions of cases of infectious gastrointestinal diseases each year, costing billions of dollars in medical care and lost productivity. In addition, new Foodborne diseases are likely to emerge driven by factors such as pathogen evolution, changes in agricultural and food manufacturing practices, and changes to the human host status. A third problem is that there are growing concerns that terrorists could use pathogens to contaminate food and water supplies in attempts to incapacitate thousands of people and disrupt economic growth. Fuelled by these concerns research into the genomics, molecular biology and microbiology of the most important Foodborne pathogens has escalated to unprecedented levels in recent years.

Written by leaders in the field, this book represents a cutting edge summary of all the latest advances, providing the first coherent picture of the current status. Opening chapters tackle topics such as pathogen detection (molecular, biosensor), molecular typing, viable but non-culturable organisms, predictive modeling, and stress responses. The next section covers groups of organisms: enteric viruses, protozoan parasites, and mycotoxins. This is followed by chapters on specific bacteria: Yersinia enterocolitica, Vibrio spp., Staphylococcus aureus, Campylobacter Infections, Listeria monocytogenes, Salmonella spp., Shigella spp., Escherichia coli, Clostridium botulinum, Clostridium perfringens and Bacillus cereus. The final chapters provide a fascinating review of the ability of pathogens to contaminate a food supply and provide an overview of emerging Foodborne pathogens. The book is essential reading for all microbiologists and food scientists and of particular interest to anyone involved in food safety.

Chapter 1. Molecular Approaches for Detection, Identification, and Analysis of Foodborne Pathogens. Pina M. Fratamico and Darrell O. Bayles
Chapter 4. Molecular Typing and Differentiation of Foodborne Bacterial Pathogens. Franco Pagotto, Nathalie Corneau, Chris Schertz, Peter Leopold, Clifford Clark and Jeffrey M. Farber
Chapter 5. Stress Responses of Foodborne Pathogens, with Specific Reference to the Switching-On of Such Responses. Robin J. Rowbury
Chapter 6. Viable but Nonculturable Bacteria in Food Environments. James D. Oliver
Chapter 7. Modeling Pathogen Behavior in Foods. Mark L. Tamplin
Chapter 9. Food-and Waterborne Protozoan Parasites. Ynes Ortega
Chapter 11. Yersinia enterocolitica. Truls Nesbakken
Chapter 12. Vibrio spp., Mitsuaki Nishibuchi and Angelo DePaola
Chapter 13. Staphylococcus aureus. George C. Stewart
Chapter 14. Campylobacter Infections. Irving Nachamkin and Patricia Guerry
Chapter 15. Listeria monocytogenes. George C. Paoli, Arun Bhunia and Darrell O. Bayles
Chapter 16. Salmonella spp., Helene L. Andrews and Andreas J. Bäumler
Chapter 17. Shigella spp., Keith A. Lampel
Chapter 20. Bacillus cereus. Per Einar Granum
